C5W3L01 Basic Models

Example no.1 about machine translation
First network here is like an encoder, and the 2nd one is decoder.
Encoder takes the input sequence and transforms it to encoded representation, while decoder ingests encoded part and output resulting sequence step by step

Example no.2 - inputting image and outputting a description of what's happening
Main idea: encode the image and use its encoding for generating sequence that describes what's happening here

Image captioning
